pLINEDEST
```

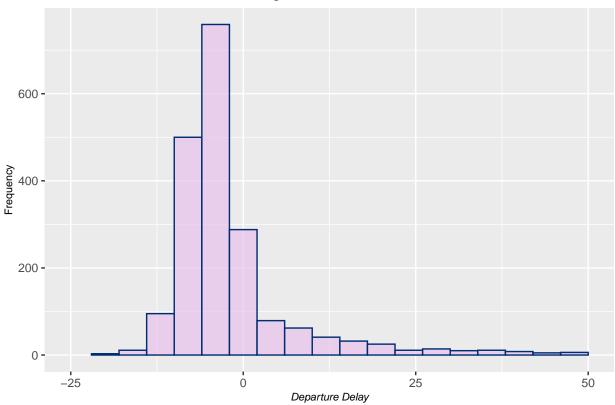

Bar Plot of Airlines by Destination

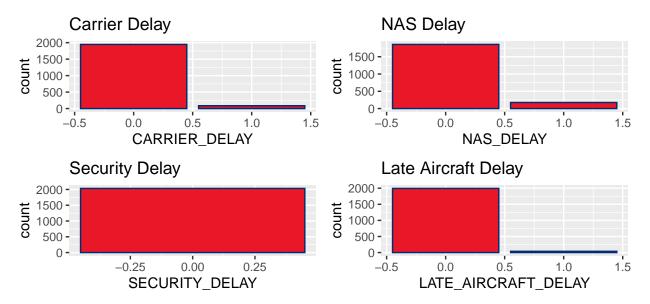

Depart Delay Histogram

```
# plot DEP_DELAY
pDEPDELAY <- ggplot(data = flights, aes(x = DEP_DELAY)) +
    geom_histogram(binwidth = 4, fill = "#e9c2ed", color = "#002D72", alpha = 0.7) +
    xlim(-25, 50) +
    labs(x = "Departure Delay",
        y = "Frequency",
        title = "Histogram of DEP_DELAY") +
    theme(plot.title = element_text(size = 12,hjust = 0.5),
        plot.subtitle = element_text(hjust = 0.5),
        axis.title.x.bottom = element_text(size = 8, face = "italic"),
        axis.title.y.left = element_text(size = 8))</pre>
```

Histogram of DEP_DELAY

```
# plot types of delays
p1 <- ggplot(data = flights, aes(x = CARRIER_DELAY)) +
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "Carrier Delay")
\#p2 \leftarrow ggplot(data = flights, aes(x = WEATHER_DELAY)) +
  #geom_bar(fill = "#E81828", color = "#002D72") +
  #labs(title = "Weather Delay")
p3 <- ggplot(data = flights, aes(x = NAS_DELAY)) +
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "NAS Delay")
p4 <- ggplot(data = flights, aes(x = SECURITY_DELAY)) +
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "Security Delay")
p5 <- ggplot(data = flights, aes(x = LATE_AIRCRAFT_DELAY)) +</pre>
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "Late Aircraft Delay")
grid.arrange(p1,p3,p4,p5, nrow = 3)
```

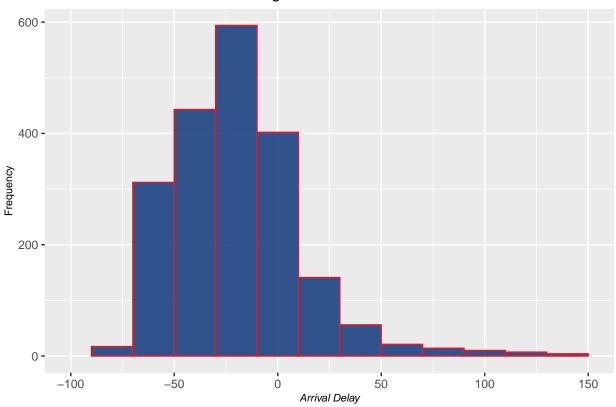

From this EDA of the categorical variables, we probably should not perform analysis with SECURITY_DELAY since all of them are classified as 0.

Furthermore, only 9 flights are classified with a weather delay, so it may not be good for our model to include this as a variable for right now.

Overall, the categorical delay predictors I would think we could use are: Carrier Delay, NAS Delay, and Late Aircraft Delay

Response Variable EDA

Histogram of ARR_DELAY

Predictors vs. Response EDA

TAXI_IN / TAXI_OUT vs. ARR_DELAY

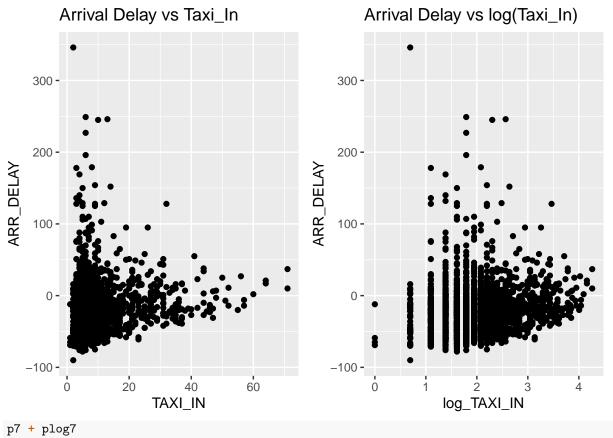

```
p6 <- ggplot(data = flights, aes(y = ARR_DELAY, x = TAXI_IN)) +
    geom_point() +
    labs(title = "Arrival Delay vs Taxi_In")

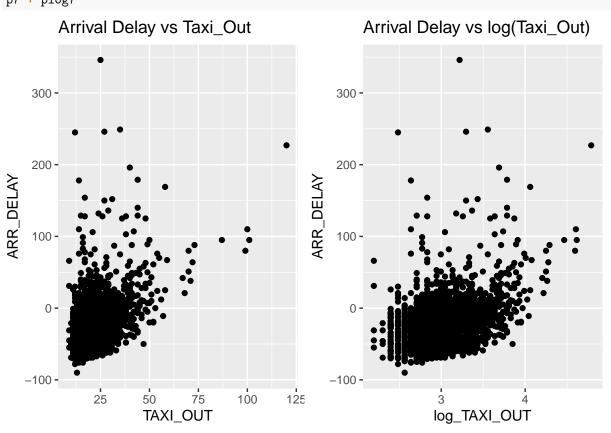

p7 <- ggplot(data = flights, aes(y = ARR_DELAY, x = TAXI_OUT)) +
    geom_point() +
    labs(title = "Arrival Delay vs Taxi_Out")

plog6 <- ggplot(data = flights, aes(y = ARR_DELAY, x = log_TAXI_IN)) +
    geom_point() +
    labs(title = "Arrival Delay vs log(Taxi_In)")

plog7 <- ggplot(data = flights, aes(y = ARR_DELAY, x = log_TAXI_OUT)) +
    geom_point() +
    labs(title = "Arrival Delay vs log(Taxi_Out)")

p6 + plog6</pre>
```

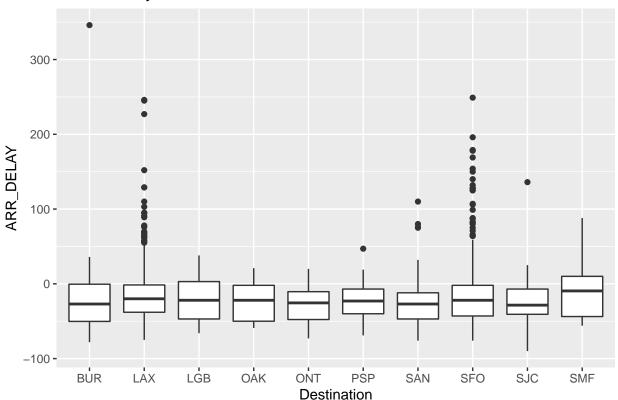

These plots above suggest that we may want to transform the variables at some point.

DEST vs. ARR_DELAY

Arrival Delay vs Destination

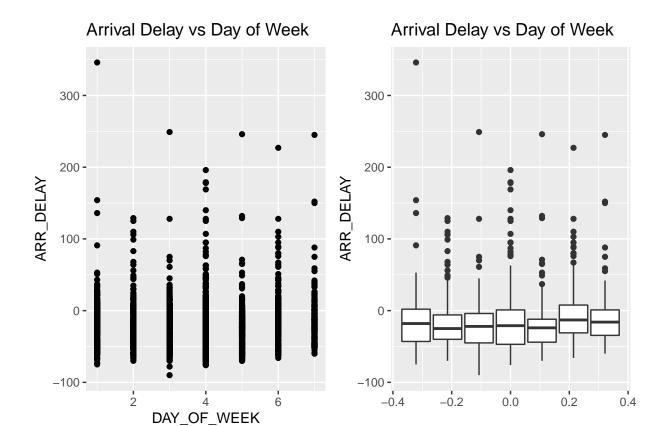

DAY_OF_WEEK vs. ARR_DELAY

```
p8 <- ggplot(data = flights, aes(y = ARR_DELAY, x = DAY_OF_WEEK)) +
    geom_point() +
    labs(title = "Arrival Delay vs Day of Week")

p9 <- ggplot(data = flights, aes(y = ARR_DELAY, group = DAY_OF_WEEK)) +
    geom_boxplot() +
    labs(title = "Arrival Delay vs Day of Week")

p8 + p9</pre>
```

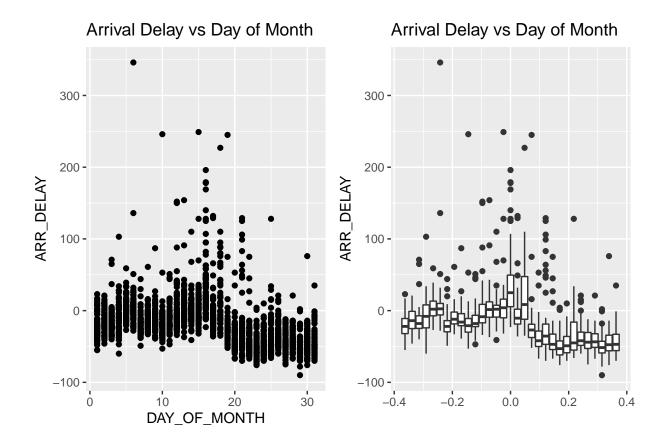

ARR_DELAY and DAY_OF_MONTH

```
p10 <- ggplot(data = flights, aes(y = ARR_DELAY, x = DAY_OF_MONTH)) +
    geom_point() +
    labs(title = "Arrival Delay vs Day of Month")

p11 <- ggplot(data = flights, aes(y = ARR_DELAY, group = DAY_OF_MONTH)) +
    geom_boxplot() +
    labs(title = "Arrival Delay vs Day of Month")

p10 + p11</pre>
```

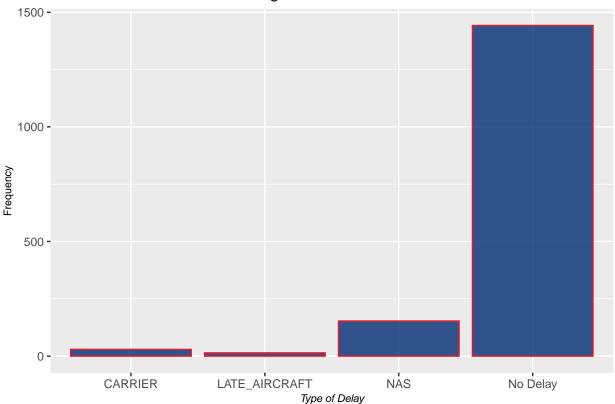

Additional Data Cleaning

New Bounds and Variable

```
# take only SFO/LAX since all 4 carriers fly there
# create TYPE_DELAY as a factor variable for type of delays
flights <- flights %>%
  filter(DEST == "SFO" | DEST == "LAX") %>%

(3) Tree-Based Models

(a) Random Forests

By default, randomForest() uses p/3 variables when building a random forest of regression trees.

```
set.seed(1)
# optimal number of predictors (param = mtry) used = 2 based on CV
rf.delay <- randomForest(ARR_DELAY ~ DAY_OF_MONTH +</pre>
```

```
TAXI_IN +
TAXI_OUT +
DEST +
DEP_DELAY +
CARRIER_DELAY +
NAS_DELAY,
data = train, na.action = na.omit, importance = TRUE,
ntree=10000, mtry=2)
```

Using the importance() function, we can view the importance of each variable.

importance(rf.delay)

```
##
                    %IncMSE IncNodePurity
## DAY_OF_MONTH
                 339.08627
                                 368261.46
## TAXI_IN
                   92.93643
                                  64905.19

                                 534776.35
## CARRIER_DELAY
                   83.95478
                                 103105.51
## NAS_DELAY
                  153.05251
                                 262232.63
```

Two measures of variable importance are reported. The former is based on the mean decrease in accuracy in predictions on the out of bag samples when a given variable is excluded from the model. The latter is a measure of the total decrease in node impurity that results from splits over that variable, averaged over all trees (this was plotted in Figure 8.9 in the text). In the case of regression trees, the node impurity is measured by the training RSS and for classification trees by the deviance. Plots of these importance measures can be produced using the varImpPlot() function.

```
varImpPlot(rf.delay)
```

rf.delay

(b) Boosting

Iter

TrainDeviance

Here we use the gbm() package, and within it the gbm() function, to fit boosted regression trees to the train data set. We run gbm() with the option distribution = "gaussian" since this is a regression problem. The argument n.trees = 150 indicates that we want 150 trees, and the option interaction.depth = 3 limits the depth of each tree.

99.2406

92.5674

87.5723

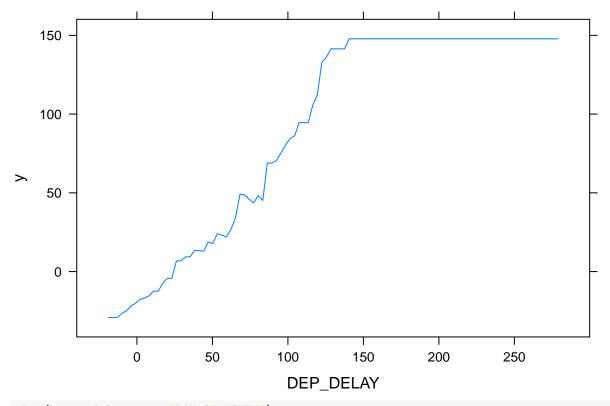

The summary() function also provides a relative influence plot and also outputs the relative influence statistics. summary(boost.delay)

```
## Var rel.inf
## DEP_DELAY DEP_DELAY 56.5279213
## DAY_OF_MONTH DAY_OF_MONTH 25.0608132
## NAS_DELAY NAS_DELAY 9.3867001
## TAXI_OUT TAXI_OUT 5.0157480
## TAXI_IN TAXI_IN 3.0135950
## LATE_AIRCRAFT_DELAY LATE_AIRCRAFT_DELAY 0.5862760
## CARRIER DELAY CARRIER DELAY 0.4089464
```

We see that DEP_DELAY and DAY_OF_MONTH are by far the most important variables. We can also produce partial dependence plots for these two variables. These plots illustrate the marginal effect of the selected variables on the response after integrating out the other variables.

```
par(mfrow = c(1,2))
plot(boost.delay, i = "DEP_DELAY")
```
