#### **Destination Locations**

Origin is all JFK, but we could consider the different destination locations.

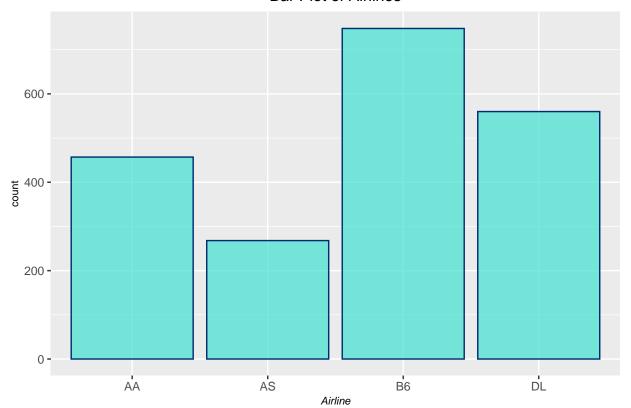

```
# plot destinations in CA
ggplot(data = flights, aes(x = DEST)) +
  geom_bar(fill = "#40E0D0", color = "#002D72", alpha = .7) +

        axis.title.x.bottom = element_text(size = 8, face = "italic"),
        axis.title.y.left = element_text(size = 8))
```

### Bar Plot of Destinations

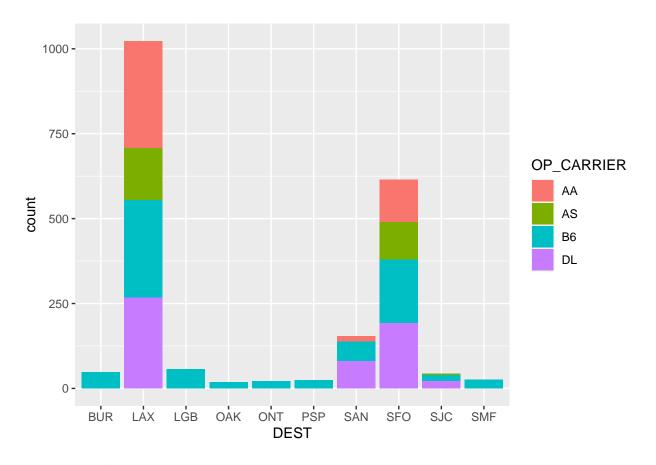

## Airlines

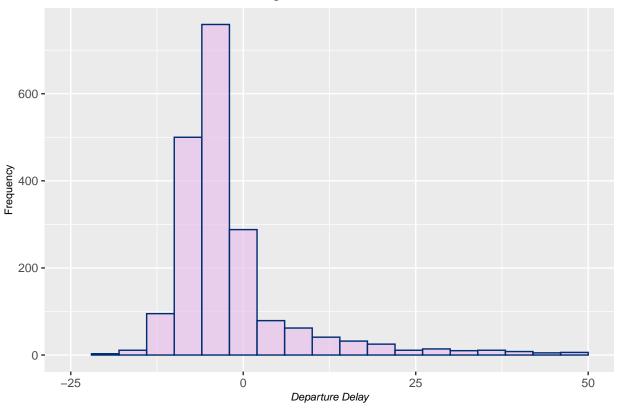

```
# plot airlines by destination
ggplot(data = flights, aes(x = DEST, fill = OP_CARRIER)) +
geom_bar()
```

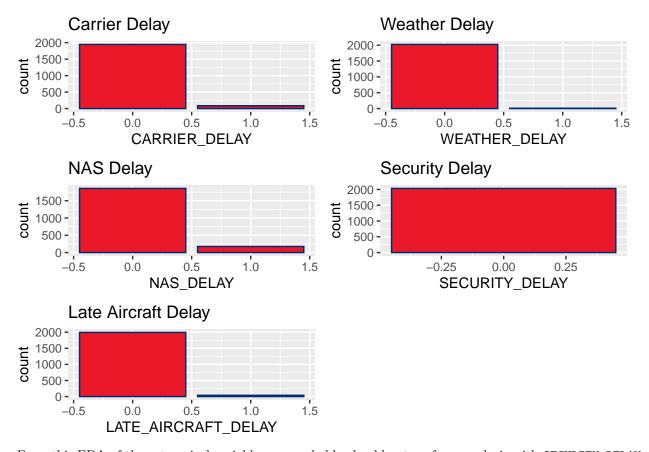

### Depart Delay Histogram

# Histogram of DEP\_DELAY

```
# plot types of delays
p1 <- ggplot(data = flights, aes(x = CARRIER_DELAY)) +
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "Carrier Delay")
p2 <- ggplot(data = flights, aes(x = WEATHER_DELAY)) +</pre>
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "Weather Delay")
p3 <- ggplot(data = flights, aes(x = NAS_DELAY)) +
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "NAS Delay")
p4 <- ggplot(data = flights, aes(x = SECURITY_DELAY)) +
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "Security Delay")
p5 <- ggplot(data = flights, aes(x = LATE_AIRCRAFT_DELAY)) +</pre>
  geom_bar(fill = "#E81828", color = "#002D72") +
  labs(title = "Late Aircraft Delay")
grid.arrange(p1,p2,p3,p4,p5, nrow = 3)
```

From this EDA of the categorical variables, we probably should not perform analysis with SECURITY\_DELAY since all of them are classified as 0.

Furthermore, only 9 flights are classified with a weather delay, so it may not be good for our model to include this as a variable for right now.

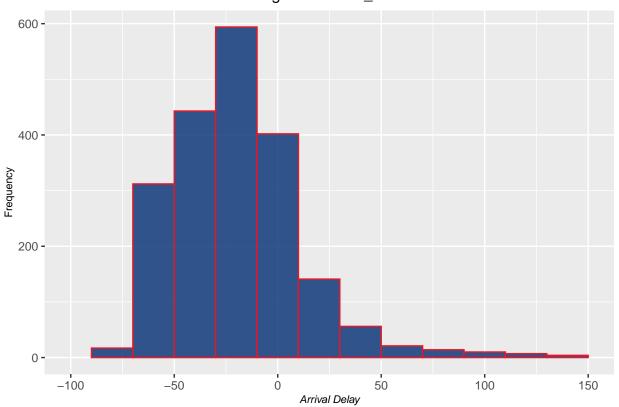

Overall, the categorical delay predictors I would think we could use are: Carrier Delay, NAS Delay, and Late Aircraft Delay

#### RESPONSE VARIABLE: ARRIVAL DELAY TIME

I just made it a different color so that when I scroll up to look at distributions I can easily tell the response from predictors (definitely can change at the end).

```
title = "Histogram of ARR_DELAY") +
theme(plot.title = element_text(size = 12,hjust = 0.5),
    plot.subtitle = element_text(hjust = 0.5),
    axis.title.x.bottom = element_text(size = 8, face = "italic"),
    axis.title.y.left = element_text(size = 8))
```

# Histogram of ARR\_DELAY

# 2-parameter BC transformation
## can apply to GAM

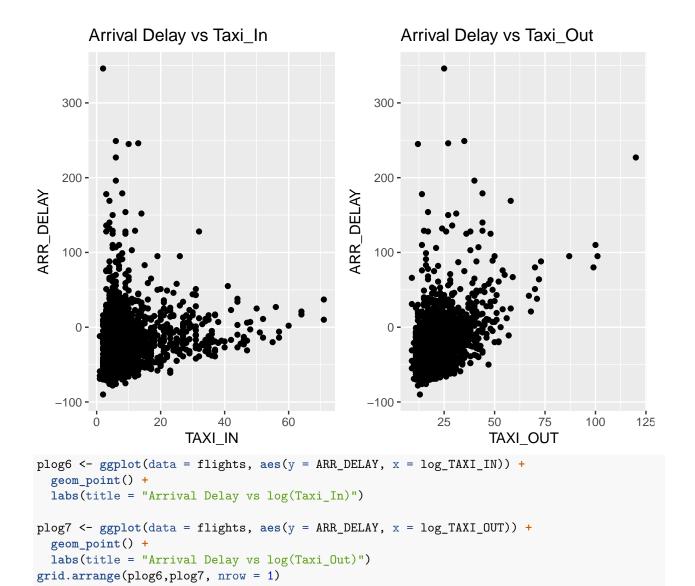

### PREDICTORS VS RESPONSE

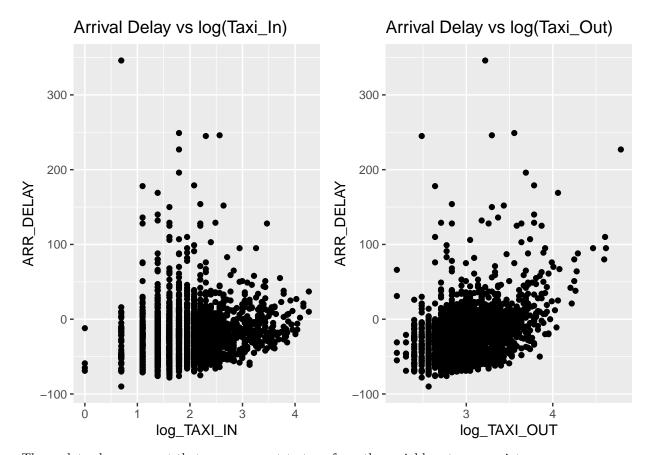

### ARR\_DELAY and TAXI\_IN / TAXI\_OUT

```
p6 <- ggplot(data = flights, aes(y = ARR_DELAY, x = TAXI_IN)) +
    geom_point() +
    labs(title = "Arrival Delay vs Taxi_In")

p7 <- ggplot(data = flights, aes(y = ARR_DELAY, x = TAXI_OUT)) +
    geom_point() +
    labs(title = "Arrival Delay vs Taxi_Out")

grid.arrange(p6,p7, nrow = 1)</pre>
```

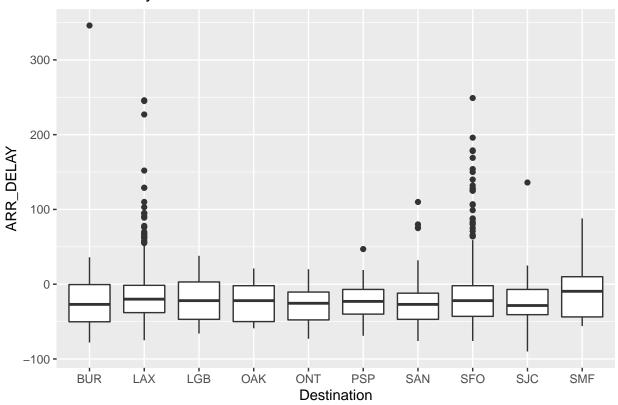

These plots above suggest that we may want to transform the variables at some point.

```
ggplot(data = flights, aes(y = ARR_DELAY, x = DEST)) +
  geom_boxplot() +
  labs(x = "Destination",
      title = "Arrival Delay vs Destination")
```

# Arrival Delay vs Destination

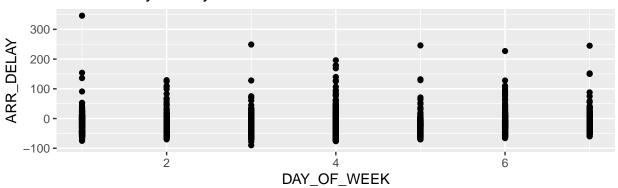

# ARR\_DELAY and DAY\_OF\_WEEK

```
p8 <- ggplot(data = flights, aes(y = ARR_DELAY, x = DAY_OF_WEEK)) +
    geom_point() +
    labs(title = "Arrival Delay vs Day of Week")

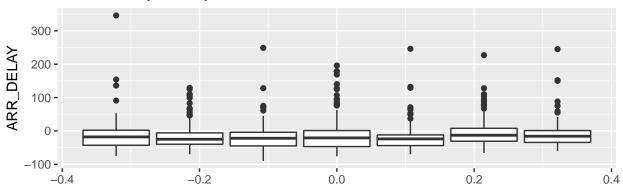

p9 <- ggplot(data = flights, aes(y = ARR_DELAY, group = DAY_OF_WEEK)) +
    geom_boxplot() +
    labs(title = "Arrival Delay vs Day of Week")

grid.arrange(p8,p9, nrow = 2)</pre>
```

# Arrival Delay vs Day of Week

# Arrival Delay vs Day of Week

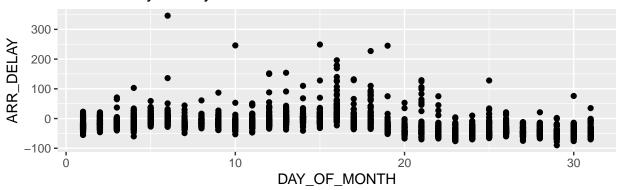

# ARR\_DELAY and DAY\_OF\_MONTH

```
p10 <- ggplot(data = flights, aes(y = ARR_DELAY, x = DAY_OF_MONTH)) +
    geom_point() +
    labs(title = "Arrival Delay vs Day of Month")

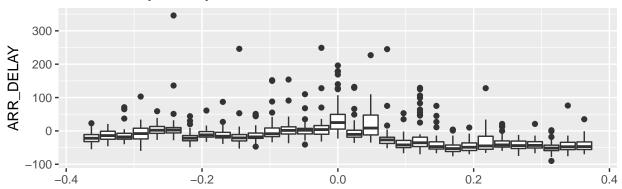

p11 <- ggplot(data = flights, aes(y = ARR_DELAY, group = DAY_OF_MONTH)) +
    geom_boxplot() +
    labs(title = "Arrival Delay vs Day of Month")

grid.arrange(p10, p11, nrow = 2)</pre>
```

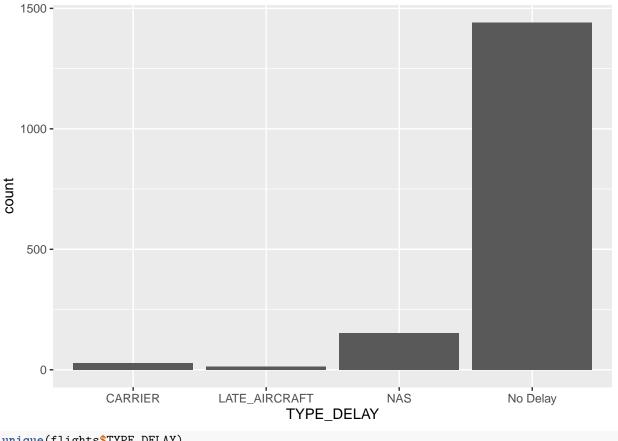

# Arrival Delay vs Day of Month

# Arrival Delay vs Day of Month

# TREES

## **Random Forests**

```
library(tree)
library(randomForest)
```

By default, randomForest() uses p/3 variables when building a random forest of regression trees.

#### rf.MSE

#### ## [1] 155.0148

Using the importance() function, we can view the importance of each variable.

#### importance(rf.delay)

##		%IncMSE	${\tt IncNodePurity}$
##	DAY_OF_MONTH	339.08627	368261.46
##	TAXI_IN	92.93643	64905.19
##	TAXI_OUT	99.21626	125258.87
##	DEST	29.76223	12009.51
##	DEP_DELAY	202.38571	534776.35
##	CARRIER_DELAY	83.95478	103105.51
##	NAS_DELAY	153.05251	262232.63

Two measures of variable importance are reported. The former is based on the mean decrease in accuracy in predictions on the out of bag samples when a given variable is excluded from the model. The latter is a measure of the total decrease in node impurity that results from splits over that variable, averaged over all trees (this was plotted in Figure 8.9 in the text). In the case of regression trees, the node impurity is measured by the training RSS and for classification trees by the deviance. Plots of these importance measures can be produced using the varImpPlot() function.

## 4. Boosting

Here we use the gbm() package, and within it the gbm() function, to fit boosted regression trees to the train data set. We run gbm() with the option distribution = "gaussian" since this is a regression problem.

The argument n.trees = 150 indicates that we want 150 trees, and the option interaction.depth = 3 limits the depth of each tree.

## Tuning parameter 'shrinkage' was held constant at a value of 0.1
##
## Tuning parameter 'n.minobsinnode' was held constant at a value of 10
## RMSE was used to select the optimal model using the smallest value.
## The final values used for the model were n.trees = 150, interaction.depth =
## 3, shrinkage = 0.1 and n.minobsinnode = 10.
# boosted model wiht cross-validated hyper-parameters

```

gbmFit

The summary() function also provides a relative influence plot and also outputs the relative influence statistics. summary(boost.delay)

```
## DEP_DELAY DEP_DELAY 56.5279213
## DAY_OF_MONTH DAY_OF_MONTH 25.0608132
## NAS_DELAY NAS_DELAY 9.3867001
## TAXI_OUT TAXI_OUT 5.0157480
## TAXI_IN TAXI_IN 3.0135950
## LATE_AIRCRAFT_DELAY LATE_AIRCRAFT_DELAY 0.5862760
## CARRIER_DELAY CARRIER_DELAY 0.4089464
```

We see that <code>DEP\_DELAY</code> and <code>DAY\_OF\_MONTH</code> are by far the most important variables. We can also produce partial dependence plots for these two variables. These plots illustrate the marginal effect of the selected variables on the response after <code>integrating</code> out the other variables.

```
par(mfrow = c(1,2))
plot(boost.delay, i = "DEP_DELAY")
```

We now use the boosted model to predict ARR\_DELAY on the test set:
